A METHOD FOR GENERATION AND ASSEMBLY OF WEB PAGE CONTENT

Abstract of the Invention

A method for dynamically converting electronically encoded HTML document from a text format to an image format. The method includes receiving a request for the

5   content from a client, obtaining the content in text format, determining a content creation preference, and converting the content in text format to content in the image format according to the content creation preference. The method includes replying to the request, wherein the reply includes the content in the image format. The method applies a watermark to the content in the image format according to a watermarking preference.

10   The method generates an image map in accordance with a mapping preference, wherein the image map relates selectable spatial display coordinates to external document identifiers.
